Objective:-

The objective of this Project is to analyze global temperature changes over time and identity climate Patterns using data science techniques It helps understand long-term warming trends and temperature variations across decades.

Data-set description:-

The Anual Temperature Anamolies dataset was obtained from our world in Data. it contains yearly temperature anoumaly records that help analyze changes in global temperature compared with a reference Period average

Approach and Techniques:-

Python was used in jupyter Notebook with Pandas, Numpy and matplotlib. The dataset was cleaned and analyzed using descriptive statistics. line and bar charts were created to visualize temperature trends and compare average anomalies across decades.

Key findings & insights:- Statistical results identity the highest, lowest & average temperature values. The graph help visualize long term temperature variation and compare across decades.

Conclusion:- The Project demonstrate how data science techniques help analyze historical global temperature

TOOL: Pandas, Numpy, matplotlib, Jupyter,
